

Day -2

About JWT

JWT stands for json web token.

web is the mideator for client and server.

jwt consist some algorithms which prevents misleading of data during data transfer.

clauses in java:

JwtService,jwtUtil,jwtTokenProvider.

create jwt token using generate token.

example code for genarating ,extracting and validating

```
"public class JwtUtil {  
    // Create JWT Token  
  
    public String generateToken(String username) {  
        String token = jwtUtil.generateToken("rahul@gmail.com"/*user name*/);  
    }  
  
    // Read username from token  
  
    public String extractUsername(String token) {  
        ...  
    }  
  
    // Check whether token is valid  
  
    public boolean validateToken(String token) {  
        ...  
    }  
}"
```

header: Contains the token type and signing algorithm.

payload:the data sent to the backend

Signature:Verifies that the token hasn't been altered.
